

One Load Center. One Transfer Switch. One Package.

Now every home you build is built generator-ready.

KOHLER.
RESIDENTIAL GENERATORS

A home that's generator-ready, right from the start.

Kohler Power Systems introduces the first and only combination load center and transfer switch package available for the residential standby power market with its new Intelligent Transfer Switch. Kohler and Square D® have agreed to produce, market and sell this new electrical load distribution enclosure and automatic transfer switch as one package.

The Intelligent Transfer Switch eliminates the need for a second distribution panel and additional wiring for a standby residential generator, thus, resulting in less installation time and costs for the builder or electrical contractor.

- Combination load center and automatic transfer switch package offers a "generator-ready" home
- Makes less work for builders and electrical contractors involved in new home construction
- Provides significant savings in installation time and labor costs
- Automatic switching between main and alternate power source
- Service-entrance rated transfer switch
- 28 or 40 circuits
- In-home remote monitoring and generator control capability
- 200 amp Square D® QO® type panel
- Manual load control over which applications are supported by the available generator capacity
- Available in both NEMA 1 and NEMA 3R designs through Kohler Power Systems distribution

Square D® and QO® are registered trademarks of Schneider Electric.
